I am a passionate Front-end Developer who can't stop coding, even in my spare time.

My main expertise and passion lies in Front-end Development, making user interfaces as beautiful as they are functional, creating layouts that excite users and finding ways of making applications as small and performant as possible are just some of the things that motivate me.

I also have skills in the backend having developed Full Stack applications with MySQL and NoSQL databases as well as utilizing many Backend languages to create intuitive and functional backend app logic.

## Software Developer

I am currently a freelance remote Software Developer working from Melbourne, Australia for a Software Development Agency, **Unrealists**; who are based in Berlin, Germany.

With **Unrealists** I have worked on a German Government seminar website called **Biteg** & built internal tooling for a European Financial Investment Company **Prestacap**.

On the **Biteg** project I used **PHP Laravel, JavaScript & MySQL** to build out user interfaces, write search logic to search through the over 10,000 entry database, implement a google captcha for input forms to prevent spam & write SQL queries to tie the front and back ends together. As well as this I used **Laravel Voyager** to create a backend admin for the people at **Biteg** to be able to easily perform BREAD operations on the **MySQL** database and add, delete or modify content on the live site by using rich text editors.

On the **Prestacap** project I used **Angular, TypeScript & AG-grid** on the front end to create intuitive, responsive and pixel perfect grid interfaces to display financial information. On the Backend I used **Python** to write scripts that would scan through bank statement pdf's and extract relevant information.
